-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

## Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE \_\_\_\_\_ MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
  - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
  - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

## Status

- 1) ☒ Responsive to communication(s) filed on 11 March 2004.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

## Disposition of Claims

- 4) ☒ Claim(s) 1-6 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-6 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

## Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

## Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
  - ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.

## Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)  
Paper No(s)/Mail Date 09/28/05.
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: \_\_\_\_\_.

## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Inokuchi (US 6087888) in view of Ariyoshi (US 5659264).

Regarding claim 1, Fig. 4 of Inokuchi shows a power amplifier comprising: a field effect transistor (see Q1), a bias voltage supply terminal supplied with a positive bias voltage (see Vg1, col. 5, lines 46-51), a reference potential (see Vg2), a first resistance element (see R2), and a second resistance element (see R3). A first terminal of the first resistance element and a first terminal of the second resistance element are connected and the connection point of the first terminal of the first resistance element and the first terminal of the second resistance element is connected to a gate terminal (G1) of the field effect transistor, a second terminal of the first resistance element is connected to the bias voltage supply terminal, a second terminal of the second resistance element is connected to the reference potential; and the field effect transistor and the first

resistance element are semiconductor devices formed on the same semiconductor substrate as mentioned in col. 12, lines 6-9.

Inokuchi fails to disclose "a second resistance element with a temperature coefficient smaller than that of the first resistance element". However, Ariyoshi discloses [column 5, lines 33-46; Fig. 1] a reference voltage circuit constituted by a voltage follower wherein a divided voltage  $V_{ND1}$  established by resistors  $R_1$  (first resistance element),  $R_6$  and  $R_5$  (second resistance element) with temperature coefficient smaller than that of the first resistance element in the case where the temperature drift in the output voltage of the amplifier circuit has a positive coefficient.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the teaching of into the circuit of Inokuchi by having second resistance element with a temperature coefficient smaller than that of the first resistance element. The ordinary artisan would have been motivated to modify in the manner set forth above for at least the purpose of controlling the temperature drift.

Claims 2,4 and 6 rejected under 35 U.S.C. 103(a) as being unpatentable over Inokuchi and Ariyoshi as applied to claim 1, 3 and 5 above or below, and further in view of Abe (US 6239625).

Regarding claims 2,4 and 6, Inokuchi and Ariyoshi disclose everything as applied to claim 1, 3 and 5 except for "a resistance value of the second (or third) resistance element is variable". However Abe discloses [see Fig. 7, col. 6, lines 41-62] a power amplifier wherein the resistance values of the first or/and second resistance element(s) is/are variable.

It would have been obvious to one having ordinary skill in the art at the time the invention was made to incorporate the teaching of Abe into the circuit of Inokuchi and Ariyoshi by having variable bias resistor(s). The ordinary artisan would have been motivated to modify Inokuchi and Ariyoshi in the manner set forth for at least the purpose of controlling the gate bias voltage produced in accordance with the variations of the pinchoff voltage of the transistor as mentioned by Abe in col. 6 lines 55-62.

Regarding claim 3, Fig. 4 of Inokuchi shows a power amplifier comprising: a field effect transistor (Q1), a positive bias voltage supply terminal supplied with a positive bias voltage (Vg1), a reference potential (Vg2), a first resistance element (R2), a second resistance element (R3), and a third resistance element (R4) where in a first terminal of the first resistance element and a first terminal of the second resistance element are connected and the connection point of the first terminal of the first resistance element and the first terminal of the second resistance element is connected to a gate terminal of the field effect transistor, a second terminal of the second resistance element is connected to a first terminal of the third resistance element, a second terminal of the first resistance element is connected to the bias voltage supply terminal (Vg1), a second terminal of the third resistance element is connected to the reference potential (Vg2), and; and the field effect transistor and the first resistance element are semiconductor devices formed on the same semiconductor substrate as mentioned in col. 12, lines 6-9.

Inokuchi shows aspects of the instant invention except: " a third resistance element with a temperature coefficient smaller than those of the first resistance element and the second resistance element ". However, Ariyoshi discloses [column 5, lines 33-

Art Unit: 2817

46 and col. 3, lines 47- 49; Fig. 7] a reference voltage circuit constituted by a voltage follower wherein a third resistance element ( $r_1$ ) with a temperature coefficient smaller than those of the first resistance element ( $R_5$ ), and the second resistance element ( $R_6$ ) in the case where the temperature drift in the output voltage of the amplifier circuit has a positive coefficient, a second terminal of the second resistance element is connected to the first terminal of the third resistance element, a second terminal of the third resistance element is connected to the reference voltage, and the field effect transistor.

It would have been obvious to one ordinary skill in the art at the time the invention was made to incorporate the teaching of Ariyoshi into the circuit of Inokuchi by having a variable second resistance element. The ordinary artisan would have been motivated to modify in the manner set forth above for at least the purpose of controlling the temperature drift.

Regarding claim 5, Fig. 4 of Inokuchi shows a power amplifier comprising: a field effect transistor ( $Q_1$ ), a bias voltage supply terminal supplied with a bias voltage ( $V_{g1}$ ), a reference potential ( $V_{g2}$ ), a first resistance element ( $R_1$ ), a second resistance element ( $R_2$ ), a third resistance element ( $R_3$ ), wherein a first terminal of the first resistance element and a first terminal of the second resistance element are connected, a second terminal of the second resistance element and a first terminal of the third resistance element are connected, a connection point of the second terminal of the second resistance element and the first terminal of the third resistance element is connected to the gate terminal of the field effect transistor, a second terminal of the first resistance element is connected to the bias voltage supply terminal, a second terminal

Art Unit: 2817

of the third resistance element is connected to the reference potential, and the field effect transistor and the first resistance element are semiconductor devices formed on the same semiconductor substrate as mentioned in col. 12, lines 6-9..

Maruyama shows most aspect of the instant invention except "a second resistance with a temperature coefficient smaller than that of the first resistance element, and a third resistance element with a temperature coefficient smaller than that of the first resistance element, wherein a second terminal of the second resistance element and a first terminal of the third resistance element are connected, a connection point of those terminals is connected to a gate terminal of the field effect transistor".

However, Ariyoshi discloses [column 5, lines 33-46 and col. 3, lines 47-49; Fig. 8] a reference voltage circuit constituted by a voltage follower wherein a first resistance element ( $r_1$ ), a second resistance ( $R_5$ ) with a temperature coefficient smaller than that of the first resistance element, and a third resistance element ( $R_6$ ) with a temperature coefficient smaller than that of the first resistance element in the case where the temperature drift in the output voltage of the amplifier circuit has a positive coefficient, wherein a second resistance element and a first terminal of the third resistance element are connected, a connection point of those terminals is connected to a gate terminal of the field effect transistor.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the teaching of into the circuit of Inokuchi by having second resistance element with a temperature coefficient smaller than that of the first

Art Unit: 2817

resistance element. The ordinary artisan would have been motivated to modify in the manner set forth above for at least the purpose of controlling the temperature drift.

### ***Response to Arguments***

Applicant's arguments with respect to claims 1-6 have been considered but are moot in view of the new ground(s) of rejection.

### ***Conclusion***

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, THIS ACTION IS MADE FINAL. See MPEP 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.
